

The Aspire & MedTech Interlinx Partnership

Clinical & Educational Program Development Consultations

Aspire has partnered with MedTech Interlinx, to guide your organization in developing the vision for your telehealth program.

Since 2007, MedTec Interlinx has worked with many healthcare organizations to articulate a telehealth program development plan closely integrated with their overall strategy for healthcare programs and services. Having such a plan in place will help your organization evaluate and prioritize the implementation of the telehealth technology components and the upgrade of broadband capacity to support a detailed and phased roll-out of telehealth programs and services.

Telehealth Infrastructure & End-user Technology Assessment and Selection

To identify your specific needs, Aspire conducts an assessment of the IT infrastructure to support your telehealth program development plan. The key is to take a phased approach to upgrade and scale your IT resources in step with the growth of your telehealth program. With our MedTec partnership, can work with your clinical and educational experts to identify the end-user technology that can be integrated efficiently and cost-effectively within your existing IT infrastructure to support your telehealth program.

Broadband Assessment & Network Design

Aspire works with your IT department to assess the broadband infrastructure and make recommendations that will support the integration of the telehealth technology systems and platforms for a seamless and reliable delivery of telehealth programs and services. The network design will incorporate all elements of the broadband and telehealth technology systems to have in place over multiple phases of the telehealth program implementation. This will help with annual capital expense budgeting and grant proposals.
